

SPORTS PROTECTIVE GEAR

Abstract of the Disclosure

Protective gear is provided having a sliding surface with a relatively low coefficient of friction so that the sliding surface can slide readily over a dry playing surface. In one embodiment, an inner leg side of a roller hockey goalkeeper leg protection member includes the sliding surface which comprises a low friction surface treatment. As such, a goalkeeper can place the inner side of the leg protection member on a dry playing surface and can readily slide the member over the playing surface in order to shift position.
